| <input type="checkbox"/> Parkville | <input type="checkbox"/> Other (specify)    |                                    |  |  |

During an exam, you must not have in your possession, a book, notes, paper, electronic device/s, calculator, pencil case, mobile phone, smart watch/device or other material/item which has not been authorised for the exam or specifically permitted as noted below. Any material or item on your desk, chair or person will be deemed to be in your possession. You are reminded that possession of unauthorised materials, or attempting to cheat or cheating in an exam is a discipline offence under Part 7 of the Monash University (Council) Regulations.

**No exam paper or other exam materials are to be removed from the room.**

**AUTHORISED MATERIALS**

<b>OPEN BOOK</b>	<input type="checkbox"/> YES	<input checked="" type="checkbox"/> NO
<b>CALCULATORS</b> only a HP 10bII+ calculator is permitted	<input checked="" type="checkbox"/> YES	<input type="checkbox"/> NO
<b>SPECIFICALLY PERMITTED ITEMS</b> if yes, items permitted are:	<input type="checkbox"/> YES	<input checked="" type="checkbox"/> NO

**STUDENTS SHOULD NOT USE AN EXAM BOOKLET, AS THEY ARE REQUIRED TO WRITE THEIR ANSWERS ON THIS PAPER.**

*Candidates must complete this section.*

STUDENT ID: .....

DESK NUMBER: .....

## Instructions

There are four questions worth a total of 100 marks. You should attempt them all.

### QUESTION 1

This question is about tidy data, principles and practice.

(a) Fill in the blanks.

[6 marks]

A \_\_\_\_\_ is a quantity, quality, or property that you can measure. For tabular (tidy) data, these would be all the column headers.

An \_\_\_\_\_ is a set of measurements made under similar conditions (you usually make all of the measurements in an observation at the same time and on the same object).

The \_\_\_\_\_ of a variable typically changes from observation to observation.

**Word bank:** *value, name, observation, object, variable, variance, variability, variation, case, subject, data point, measure, type, model, regression.*

*variable, observation, value*

(b) From the following summary,

```
> glimpse(grad)
Observations: 412
Variables: 16
$ subject      <chr> "economics", "economics", "economics", "economic...
$ Inst         <chr> "ARIZONA STATE UNIVERSITY", "AUBURN UNIVERSITY",...
$ AvNumPubs    <dbl> 0.90, 0.79, 0.51, 0.49, 0.30, 0.84, 0.99, 0.43, ...

```

(i) How many observations? \_\_\_\_\_

[2 marks]

16

(ii) How many variables? \_\_\_\_\_

[2 marks]

4

(iii) Which variables would be considered to be categorical? \_\_\_\_\_

[2 marks]

iso3, gender, age

(iv) What value indicates missing information? \_\_\_\_\_

[2 marks]

NA

(v) Map out the steps that you would need to take to get it into tidy format.

[4 marks]

- Gather into long form
- Split strings into gender and age

- (d) TRUE or FALSE: The variables used to connect multiple tables are called keys. A key is a variable (or set of variables) that uniquely identifies a measured value.

[2 marks]

---

TRUE

- (e) Identify the possible key(s) in the following data:

[2 marks]

---

```
> library(babynames)
> babynames
# A tibble: 1,858,689 x 5
  year sex  name      n  prop
  <dbl> <chr> <chr>   <int> <dbl>
1 1880. F    Mary    7065 0.0724
2 1880. F    Anna    2604 0.0267
3 1880. F    Emma    2003 0.0205
4 1880. F  Elizabeth 1939 0.0199
5 1880. F   Minnie   1746 0.0179
6 1880. F  Margaret 1578 0.0162

year, sex, name

[Total: 28 marks]

— END OF QUESTION 1 —

## QUESTION 2

This question is about wrangling data, verbs, definitions and usage.

- (a) Match the verb to its usage by drawing lines to connect the verb and usage:

[6 marks]

verb	usage
filter	create new, or change, a variable
select	order a table by values in one column
mutate	operate on subsets specified by a categorical variable
summarise	subset variables
arrange	subset cases
group_by	compute a single number from a collection

verb	usage
filter	subset cases
select	subset variables
mutate	create new, or change, a variable
summarise	compute a single number from a collection
arrange	order a table by values in one column
group_by	operate on subsets specified by a categorical variable

- (b) For each of these questions, write down the verbs that you would need to use to do the calculations to answer the question about the nycflights13 data.

[10 marks]

```
> glimpse(flights)
Observations: 336,776
Variables: 15
$ year      <int> 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013...
$ month     <int> 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1...
$ day       <int> 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1...
$ dep_time  <int> 517, 533, 542, 544, 554, 554, 555, 557, 557, 558, 55...

```

- (i) Find all flights that were operated by United, American, or Delta.

filter

- (ii) What hour of day should you fly if you want to avoid delays as much as possible?

group\_by, summarise (arrange)

- (iii) Find all destinations that are flown to by at least two carriers.

---

`filter`

- (iv) Find the busiest airports.

---

`count`

- (v) Find the plane (identified by their tail number) that has the highest average delays.

---

`group_by`, `summarise` (`arrange`)

**Full verb list:** *filter, select, mutate, summarise, arrange, group\_by, near, desc, starts\_with, ends\_with, contains, matches, rename, top\_n, first, min\_rank, lag, cumsum, count, tally*

[Total: 16 marks]

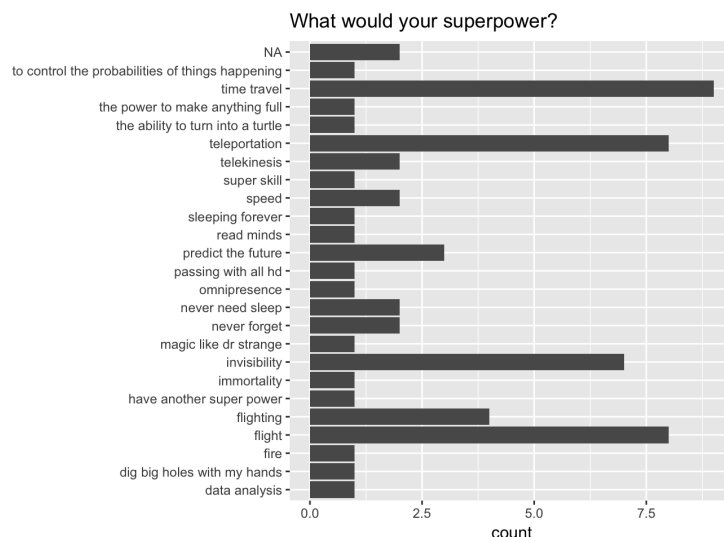

— END OF QUESTION 2 —

### QUESTION 3

This question is about making good plots of data.

(a) How would you improve the following plot?

[2 marks]

sort the categories

(b) Each of the following two plots was produced to answer the question *how does taking ETC1010 as core or elective vary by year in school?*

A Type of unit vs year at uni

B Type of unit vs year at uni

(i) Which variable is the explanatory variable?

[2 marks]

current year of uni

(ii) Which display makes it easier to answer the question? Explain your answer.

[4 marks]

Display 2. The focus is then on proportion of core/elective by year in uni.

(iii) Give one suggestion to improve the plot.

[2 marks]

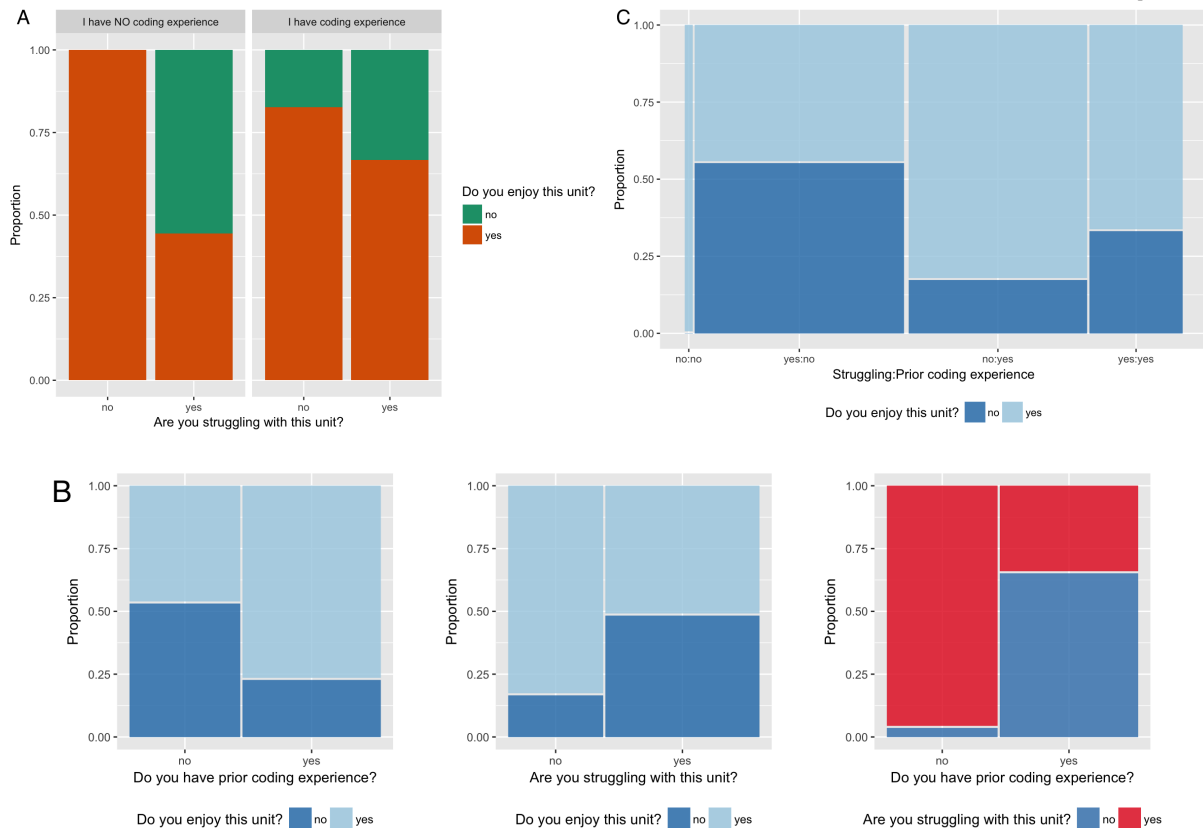

---

use a mosaic plot

- (c) Below are three plots (A, B, C) made to examine *how enjoyment of the unit, and whether you are struggling, depends on having prior coding experience or not*. Write a paragraph describing the pros and cons of each display, in addressing the purpose.

[6 marks]

---

---

---

---

---

---

---

---

Plot A shows three variables in the one display. The only possible comparison is the variable mapped to colour, difference in proportion in the categories of the other two variables.

Plot B shows all pairs of variables, displayed in separate mosaic plots. We can do all pairwise comparisons, and also see relative numbers in each category.

Plot C shows all three variables in one display, and with the mosaic style it can be seen that the "not struggling/no prior coding experience" has only one person.

- (d) John Tukey said "The greatest value of a picture is when it forces us to notice what we never 5cm to see.? What is the missing word?

[2 marks]

☐ wanted    ☐ tried    ☐ expected    ☐ wanted  
expected

- (e) Which of the following are true about the grammar of graphics?

[3 marks]

☐ the variables are directly mapped to an element in the plot

☐ it is possible to see how one display is similar or different from another, rather than thinking of plots like animals in a zoo, specific beasts (pie chart, barchart, scatterplot, ?)

☐ themes are one of the seven components

the first two

**[Total: 21 marks]**

**— END OF QUESTION 3 —**

## QUESTION 4

This question is about multiple regression modelling.

- (a) For the model  $y = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \varepsilon$ , what is the correct model formula in R?

[3 marks]

☐ `y ~ x1 + x2`   ☐ `y ~ x1 * x2`   ☐ `y ~ x1 + x2 - 1`   ☐ `y ~ b1*x1 + b2*x2`  
`y ~ x1 * x2`

- (b) If you wanted to force the intercept to go through 0 what the formula be? (write it out here)

[2 marks]

`y ~ x1 * x2 - 1`

- (c) It's also useful to see what the model doesn't capture, the so-called 5cm which are left after subtracting the predictions from the data.

[2 marks]

☐ fitted values   ☐ residuals   ☐ predictions   ☐ coefficients

residuals

- (d) The following plot shows the residuals from two different model fits (*mod1*, *mod2*). Which model (or both, or neither) best captures the original structure in the data? Explain your answer.

[3 marks]

mod2 because there is structure remaining in the residuals for mod1

(e) The following plot shows the fitted values from two different model fits.

[4 marks]

ence — Strongly disagree — Disagree Enjoy science — Strongly disagree — Disagree — Agree

(i) Which model (or both, or neither) contains an interaction term? Explain your answer.

Model 2, because there is a different slope for each group.

(ii) Is the interaction with a categorical or quantitative variable?

categorical

(f) TRUE or FALSE: Adding an interaction between two quantitative variables to the model enables a nonlinear relationship to be fitted.

[2 marks]

TRUE

(g) From the following model summary, for science score,

term	estimate	std.error
<chr>	<dbl>	<dbl>
(Intercept)	4.633345e+02	43.50881
log_science_time	-3.995844e-03	18.60566
science_fun_cDisagree	-1.518829e+02	55.46131
science_fun_cAgree	-1.667660e+02	48.13726
science_fun_cStrongly agree	-1.224884e+02	53.60320
log_science_time:science_fun_cDisagree	7.864348e+01	23.75214
log_science_time:science_fun_cAgree	9.840520e+01	20.56815
log_science_time:science_fun_cStrongly agree	9.693076e+01	22.78145

8 rows | 1-3 of 5 columns

(i) Write out the fitted model equation(s).

[3 marks]

---

Strongly disagree:  $science = 463 - 0.004 \log science\ time$

Disagree:  $science = 312 + 78 \log science\ time$

Agree:  $science = 297 + 98 \log science\ time$

Strongly agree:  $science = 341 + 97 \log science\ time$

- (ii) For a new observation where science\_time=1000, and science\_fun is Agree, predict the average science score.

[3 marks]

---

591

- (iii) Would be the predicted average score for a student who answered Strongly agree for science\_fun be higher? Why?

[2 marks]

---

Yes, the intercept is much higher, and the rate of change not enough to offset the big difference.

- (iv) What was the purpose of using the log transformed values for science\_time, do you think?

[3 marks]

It probably had a right-skewed distribution.

- (h) From the model summary, this is the equation describing the fitted model. TRUE or FALSE

[2 marks]

$$\log(\text{Price}) = 5.873 + 0.080\text{Rooms} + 0.051\text{Bathroom} - 0.016\text{Distance}$$

FALSE!

- (i) When imputing missing values in preparation for fitting a multiple linear model, we will use a separate regression model for the variable with missing values. The variable containing missing values, will be regressed on other explanatory variables, using the complete cases. Explain why it is not a good idea to use the response variable to do the imputation.

[3 marks]

---

Using the response to impute explanatory variables isn't advised because it will affect your model, actually it is likely to artificially inflate the model fit statistics.

- (j) Of the two models (mod3 or mod4), based on the fit statistics below, which is the best? Explain your answer.

[3 marks]

```
> glance(mod3)
  r.squared adj.r.squared    sigma statistic p.value df
1 0.3545374    0.354395 0.1802053  2489.321      0   7
  logLik      AIC      BIC deviance df.residual
1 8019.584 -16023.17 -15957.48  883.032      27192
> glance(mod4)
  r.squared adj.r.squared    sigma statistic p.value df
1 0.5315746    0.5314196 0.1535252   3428.14      0  10
  logLik      AIC      BIC deviance df.residual
1 12378.79 -24735.57 -24645.25  640.8208      27188
```

---

mod4 because the  $R^2$  is much higher, and the deviance is much lower.

[Total: 35 marks]

— END OF QUESTION 4 —

## Formula sheet

### Summary statistics

$$\bar{y} = \frac{1}{n} \sum_{i=1}^n y_i, \quad s_y = \sqrt{\frac{\sum_{i=1}^n (y_i - \bar{y})^2}{n-1}}, \quad r_{xy} = \frac{\sum_{i=1}^n (x_i - \bar{x})(y_i - \bar{y})}{(n-1)s_x s_y}$$

Types of variables: categorical, quantitative, logical, date.

Descriptive words for univariate distributions:

- unimodal, bimodal, multimodal
- symmetric, right-skewed, left-skewed, uniform
- outliers

Descriptive words for bivariate distributions:

- shape: linear, non-linear, no relationship
- strength: weak, moderate, strong
- form: positive, negative

### Tidy data

Verbs: gather, spread, nest/unnest, separate/unite

### Wrangling data

Verbs: filter, arrange, select, mutate, summarise, group/ungroup

### Grammar of graphics

There are seven components of the grammar that define a data plot: DATA, AESTHETICS/MAPPINGS, GEOM, STAT, POSITION, COORDINATE, FACET.

Colour palettes: sequential, diverging, qualitative

### Models

Simple linear:

$$Y = \beta_0 + \beta_1 X + \varepsilon$$

- $\varepsilon \sim N(\mu, \sigma)$
- Fitted values:  $\hat{Y} = b_0 + b_1 X$
- Residual:  $e = Y - \hat{Y}$
- Estimates:  $b_1 = r \frac{s_y}{s_x}$ ,  $b_0 = \bar{Y} - b_1 \bar{X}$
- $R^2 = 1 - \frac{\sum e^2}{\sum Y^2}$
- $MSE = \frac{\sum_{i=1}^n (y_i - \hat{y}_i)^2}{(n-2)}$
- $RMSE = \sqrt{MSE}$
- $MAE = \frac{\sum_{i=1}^n |y_i - \hat{y}_i|}{(n-2)}$
